- (54) Titre: DERIVES DE PIPERAZINE-4-PHENYLE SERVANT D'INHIBITEURS DE L'INTERACTION ENTRE MDM2 ET p53

(57) Abstract

A compound of formula (1), wherein: R¿5 is hydrogen, C¿1-4alkyl, R¿6CH¿2- or R¿6C(O)-; R¿6 is aryl, heteroaryl, heterocyclyl, aminoC¿3-6alkyl, <u>N</u>-(diC¿1-4alkyl)aminoC¿3-6alkyl, or R¿7; wherein the aryl, heteroaryl or heterocyclyl rings may be optionally substituted with up to three substituents independently selected from nitro, C¿1-4alkyl, C¿1-4alkoxy, halo, (C¿1-4alkyl)sulfanyl, C¿1-4alkoxycarbonyl, <u>N</u>-(C¿1-4alkyl)carbamoyl, <u>N</u>-(C¿1-4alkyl)amino or <u>NN</u>-(diC¿1-4alkyl)amino; wherein R¿7 is either a group or formula (2) or formula (3); and wherein L¿1, L¿2, L¿3, L¿4, R¿1, R¿2, R¿3, R¿4, R¿8, R¿9, R¿10, R¿11, R¿12, R¿13, A¿1, n, p, q, r and s are as defined in claim 1. The compounds of formula (1) inhibit the interactions between MDM2 and p53 and may be useful in the treatment of cancers.

(57) Abrégé

L'invention concerne un composé correspondant à la formule: dans laquelle R¿5 est hydrogène, alkyle C¿1-4, R¿6CH¿2- ou R¿6C(O)-; R¿6 est aryle, hétéroaryle, hétérocyclyle, amino C¿3-6 alkyle, <u>N</u>-(C¿1-4alkyle)aminoC¿3-6alkyle, <u>NN</u>-(diC¿1-4alkyle)aminoC¿3-6alkyle, ou R¿7, dans laquelle les noyaux aryle, hétéroaryle ou hétérocyclyle peuvent être éventuellement substitués par jusqu'à trois substituants sélectionnés indépendamment entre nitro, C¿1-4alkyle, C¿1-4alcoxy, halo, (C¿1-4alkyl) sulfanyle, C¿1-4alcoxycarbonyle, <u>N</u>-(C¿1-4alkyl)carbamoyle, <u>NN</u>-(diC¿1-4alkyl)carbamoyle, <u>NN</u>-(diC¿1-4alkyl)amino ou <u>NN</u>-(diC¿1-4alkyl)amino; R¿7 étant un groupe correspondant à la formule (2) ou à la formule (3): formule (3) L¿1, L¿2, L¿3, L¿4, R¿1, R¿2, R¿3, R¿4, R¿8, R¿9, R¿10, R¿11, R¿12, R¿13, A¿1,n,p,q,r et sétant définis dans la revendication 1. Les composés de la formule (1) freinent les interactions entre la protéine MDM2 et p53 et peuvent servir à traiter des cancers.

(57) Abstract

A compound of formula (1), wherein: R5 is hydrogen, C1-4alkyl, R6CH2- or R6C(O)-; R6 is aryl, heteroaryl, heteroacylyl, aminoC3_6alkyl, N-(C1_4alkyl)aminoC3_6alkyl, NN-(diC1_4alkyl)aminoC3_6alkyl, or R7; wherein the aryl, heteroaryl or heterocyclyl rings may be optionally substituted with up to three substituents independently selected from nitro, C1-4alkoxy, halo, (C1-4alkyl)sulfanyl, C₁₋₄alkoxycarbonyl, N-(C₁₋₄alkyl)carbamoyl, N-(diC₁₋₄alkyl)carbamoyl, N-(C₁₋₄alkyl)amino or NN-(diC₁₋₄alkyl)amino; wherein R₂ is either a group or formula (2) or formula (3); and wherein L₁, L₂, L₃, L₄, R₁, R₂, R₃, R₄, R₈, R₉, R₁₀, R₁₁, R₁₂, R₁₃, A₁, n, p, q, r and s are as defined in claim 1. The compounds of formula (1) inhibit the interactions between MDM2 and p53 and may be useful in the treatment of cancers.

50

This invention relates to compounds which inhibit the interaction between MDM2 5 and the tumour suppressor protein, p53. This invention also relates to processes for the manufacture of MDM2/p53 interaction inhibitors and pharmaceutically acceptable salts, prodrugs or solvates thereof, to novel pharmaceutical compositions containing them and to the use of the compounds as probes of MDM2 and p53 function.

p53 is a transcription factor which plays a pivotal role in the regulation of the balance 10 between cell proliferation and cell growth arrest/apoptosis. Under normal conditions the half life of p53 is very short and consequently the level of p53 in cells is low. However, in response to cellular DNA damage or cellular stress, levels of p53 increase. This increase in p53 levels leads to the activation of the transcription of a number of genes which induces the cell to either growth arrest or to undergo the processes of apoptosis. Thus the function of p53 15 is to prevent the proliferation of transformed cells and thus protect the organism from the development of cancer (for a review see Levine 1997, Cell 88, 323-331).

MDM2 is a key negative regulator of p53 function, which binds to the amino terminal transactivation domain of p53. MDM2 both inhibits the ability of p53 to activate transcription and targets p53 for proteolytic degradation, thus maintaining the low levels of p53 under 20 normal conditions. MDM2 may also have separate functions in addition to inhibition of p53. For example, MDM2 also binds another turnour suppressor protein, the retinoblastoma gene product, and inhibits it ability to activate transcription. For reviews of MDM2 function see: Piette et al (1997) Oncogene 15, 1001-1010; Lane and Hall (1997) TIBS 22, 372-374; Lozano and de Oca Luna (1998) Biochim Biophys Acta 1377, M55-M59.

MDM2 is a cellular proto-oncogene. Overexpression of MDM2 has been observed in a range of cancers see Momand and Zambetti (1997) J. Cell. Biochem 64, 343-352. The mechanism by which MDM2 amplification promotes tumourigenesis is at least in part related to its interaction with p53. In cells over-expressing MDM2 the protective function of p53 is blocked and thus cells are unable to respond to DNA damage or cellular stress by increasing 30 p53 levels, leading to cell growth arrest and/or apoptosis. Thus after DNA damage and/or cellular stress cells over-expressing MDM2 are free to continue to proliferate and assume a

tumourigenic phenotype. Under these conditions disruption of the interaction of p53 and MDM2 would release the p53 and thus allow the normal signals of growth arrest and/or apoptosis to function. Thus disruption of the interaction of MDM2 and p53 offers an approach for therapeutic intervention in cancer.

15

10

A few patent applications have been published which describe peptide inhibitors of the interaction of p53 and MDM2, see: International Patent Application, WO9602642, University of Dundee; International Patent Application WO 9801467, Novartis & Cancer Research Campaign Technology Ltd.; and International Patent Application WO 9709343.

20

We have discovered a novel class of small molecule compounds which inhibit the interaction of MDM2 and p53. These compounds are useful as probes of MDM2 and p53 function and may be useful as agents for the treatment of cancer.

According to the invention there is provided a compound of formula (1):

25

$$R_{5}$$
 R_{2}
 R_{3}
 R_{4}
formula (1)

30

15

/ wherein:

20

25

35

L₁ is hydrogen or methyl;

R₁ and R₂ and R₃ are each independently hydrogen, halo, nitro, cyano, carbamoyl,

N-(C_{1.4}alkyl)carbamoyl, NN-(diC_{1.4}alkyl)carbamoyl or C_{1.4}alkoxycarbonyl;

40

R₄ is indole, N-(C₁₄ alkyl) indole, C₅, carbocyclic ring or aryl, any of which can be optionally substituted on ring carbon atoms with up to three substituents each independently selected from halo, C₁₄ alkyl, or C₁₄ alkoxy;

45

R, is hydrogen, C_{1-4} alkyl, R_6CH_2 or $R_6C(O)$;

.

R₆ is aryl, heteroaryl, heterocyclyl, aminoC_{1.4}alkyl, N-(C_{1.4}alkyl)aminoC_{1.4}alkyl, N-(C_{1.4}alkyl)aminoC_{1.4}alkyl, or R₇; wherein the aryl, heteroaryl or heterocyclyl rings may be optionally substituted with up to three substituents independently selected from nitro, C_{1.4}alkyl, C_{1.4}alkoxy, halo, (C_{1.4}alkyl)sulfanyl, C_{1.4} alkoxycarbonyl,

55

 \underline{N} -(C_{14} alkyl)carbamoyl, \underline{NN} -(diC_{14} alkyl)carbamoyl, \underline{N} -(C_{14} alkyl)amino or \underline{NN} -(diC_{14} alkyl)amino;

10

wherein R_7 is either a group of formula (2) of formula (3):

15

13

20

5

20

Formula (2)

 R_{10} — $[CH_2]_r$ — $[CH_2]_s$ R_{13}

Formula (3)

25

30

35

40

45

wherein:

10 L₂, L₃ and L₄ are each independently hydrogen or methyl;

 R_{\bullet} is amino, guanadino, imidazolo, any of which can be mono or di-N-substituted with $C_{l\rightarrow}$ alkyl;

A, is oxygen or a direct bond;

R, is a C_{5.4} membered mono-carbocyclic ring, a C_{6.10} membered bi-carbocyclic ring,

C₁₋₁₂ membered tri-carbocyclic ring, C₁₋₂alkyl or aryl, any of which can be optionally mono, bi or tri substituted by C₁₋₄ alkyl;

R₁₀ is C_{1-s}alkyl or a C_{1-s}mono-carbocyclic ring;

R₁₁ is hydrogen, halo, C_{1.4}alkyl, or C_{1.4}alkoxy;

R₁₂ is hydrogen or methyl or ethyl or R₁₂ together with L₂ forms a C_{5.7} nitrogencontaining heterocyclic ring;

R₁₃ is hydrogen or methyl ethyl or R₁₃ together with L₄ forms a C_{5.7} nitrogen-containing heterocyclic ring;

n is 0, 1 or 2;

p is 0, 1 or 2;

25 q is an integer from 1 to 6

55

10

15

20

25

30

35

40

45

50

r is 0, 1 or 2; s is 0, 1 or 2;

provided that when R6 is aryl, heteroaryl, heterocyclyl, aminoC36alkyl,

N-(C1-alkyl)aminoC3-alkyl or NN-(diC1-alkyl)aminoC3-alkyl then R, is other than

5 R₆CH₂-; and when R₁ is hydrogen, R₂ is hydrogen, R₃ is hydrogen, L₁ is hydrogen, n is L, R₄ is phenyl, R₅ is R₆C(O)-, then R₆ cannot be 2-methyl-4-amino-butyl, or a pharmaceutically acceptable salt, prodrug or solvate thereof.

In this specification the generic term "alkyl" includes both straight-chain and branched-chain alkyl groups. However references to individual alkyl groups such as "propyl" 10 are specific for the straight-chain version only and references to individual branched-chain alkyl groups such as "isopropyl" are specific for the branched-chain version only. An analogous convention applies to other generic terms.

The term "aryl" refers to phenyl or naphthyl.

The term "heteroaryl" refers to a 5-10 membered aromatic mono or bicyclic ring 15 containing up to 5 heteroatoms selected from nitrogen, oxygen or sulphur. Examples of 5- or 6-membered heteroaryl ring systems include imidazole, triazole, pyrazine, pyrimidine, pyridazine, pyridine, isoxazole, oxazole, isothiazole, thiazole, furan, pyrazole, 1,2,3thiadiazole and thiophene. A 9 or 10 membered bicyclic heteroaryl ring system is an aromatic bicyclic ring system comprising a 6-membered ring fused to either a 5 membered ring or 20 another 6 membered ring. Examples of 5/6 and 6/6 bicyclic ring systems include benzofuran, benzimidazole, benzthiophene, benzthiazole, benzisothiazole, benzoxazole, benzisoxazole, pyridoimidazole, pyrimidoimidazole, quinoline, isoquinoline, quinoxaline, quinazoline, phthalazine, cinnoline, 4-oxo-4H-1-benzopyran and naphthyridine.

The term "heterocyclyl" refers to a 5-10 membered non-aromatic mono or bicyclic 25 ring containing up to 5 heteroatoms selected from nitrogen, oxygen or sulphur. Examples of 'heterocyclyl' include pyrrolinyl, pyrrolidinyl, morpholinyl, piperidinyl, piperazinyl, dihydropyridinyl and dihydropyrimidinyl

The term "carbocyclic ring" refers to a totally saturated or partially saturated mono, bi or tri cyclic carbon ring. Examples of carbocyclic rings are cyclopentyl, cyclohexyl, 30 cyclopentyl, bicyclo-octane or adamantyl.

The term "halo" refers to fluorine, chlorine, bromine or iodine.

15

20

25

30

35

40

45

50

The term carbamoyl refers to -C(O)NH₂.

The term "warm-blooded animal" includes human.

Examples of C1-4alkyl include methyl, ethyl, propyl, isopropyl, sec-butyl and tertbutyl; examples of C1-4alkoxy include methoxy, ethoxy and propoxy; examples of

5 C1_4alkanoyl include formyl, acetyl and propionyl; examples of C1_4alkylamino include methylamino, ethylamino, propylamino, isopropylamino, sec-butylamino and tertbutylamino; examples of di-(C1-4alkyl)amino include di-methylamino, di-ethylamino and Nethyl-N-methylamino; examples of N-(C1-4alkyl)aminoC1-4alkyl include N-methylaminomethyl and N-ethyl-aminoethyl, and examples of NN-di(C1-alkyl)aminoC1-aklyl 10 include: NN-dimethyl- aminomethyl and N-methyl-N-ethyl aminomethyl.

Examples of suitable values for R₁, R₂ or R₃ include hydrogen, halo, nitro, carbamoyl, , N-(C_{1-a}alkyl)carbamoyl, NN-(diC_{1-a}alkyl)carbamoyl or C_{1-a}alkoxycarbonyl. Preferably hydrogen, halo, nitro, carbamoyl, N-cthylcarbamoyl, NN-dimethylcarbamoyl, N-methyl-N-ethylcarbamoyl, methoxycarbonyl or ethoxycarbonyl. More preferably hydrogen,

15 halo or nitro. More preferably hydrogen, chloro or nitro. Most preferably either R₁ is halo, preferably chloro, R₂ is halo, preferably chloro and R₃ is hydrogen or R₁ is hydrogen, R₂ is nitro and R, is hydrogen.

Examples of suitable values for R₄ include indole, N-(C₁₋₁alkyl) indole, C₂₋₁carbocyclic ring or aryl, either of which can be optionally substituted by halo, C, alkyl, or C, alkoxy. 20 Preferably R, is indole, N-methylindole, cyclopentyl, cyclohexyl, phenyl or naphthyl,

optionally substituted as defined above. More preferably R, is indole, N-methylindole, cyclohexyl, or phenyl, optionally substituted as defined above. More preferably R₄ is indole, N-methylindole, or phenyl, optionally substituted as defined above. More preferably R, is phenyl, optionally substituted as defined above. Most preferable R4 is phenyl substituted with 25 halo, preferably chloro.

Examples of suitable values for R, include hydrogen, C, alkyl, R, CH2 or R, C(O) -. Preferably R, is hydrogen, methyl, R,CH, or R,C(O) -. Most preferably R, is R,C(O) -.

Examples of suitable values for R₆ include aryl, heteroaryl, heterocyclyl, amino-C_{1.6}alkyl, N-(C_{1.4}alkyl)aminoC_{1.6}alkyl, NN-(diC_{1.4}alkyl)aminoC_{1.6}alkyl, or R₂. Preferably R₆ is 30 aryl, heteroaryl, heterocyclyl, (NN-dimethyl)aminopropyl or R₂. More preferably R₄ is aryl,

10

15

20

25

30

35

40

45

50

heteroaryl, heterocyclyl or R₂. More preferably R₄ is aryl and heteroaryl. Most preferably R₄ is aryl, preferably phenyl.

Examples of substituents on the aryl ring systems of R₆ include nitro, C₁ alkyl, C₁ alkoxy, halo, (C₁ alkyl)sulfanyl. Preferably nitro, C₁ alkyl, C₁ alkoxy or methylsulfanyl. 5 More preferably nitro or C_{1.4}alkoxy. Most preferably nitro or methoxy. More preferable

substitution patterns on a phenyl group in R₆ are 2-nitro-4,5-dimethoxy, 2-methyl-3-nitro, 2-methoxy, 2,4-dimethyl, 4,5-dimethoxy-2-nitro or 2-methylsulfanyl. Most preferred is 2-nitro-4,5-dimethoxy.

Examples of suitable values for heteroaryl rings at R, include: furan, thiophene, 10 pyrrole, pyrazole, isoxazole, thiazole, thiadiazole, pyridine, pyridazine, benzofuran, 4-oxo 4H-1-benzopyran. Heteroaryl ring systems with one or two heteroatoms are preferred. Heteroaryl ring systems with one heteroatom are most preferred.

Examples of suitable values for substituents on ring carbon atoms in heterocyclic rings of R₆ include, C_{1.4}alkyl, C_{1.4}alkoxy, halo, hydroxy, oxo or C_{1.4}alkylcarbonyl.

15 Examples of suitable values for R, include amino, guanadino and imidazolo, any of which can be mono or di-N-substituted with C₁₋₄alkyl. More preferably R₈ is guanadino or amino, substituted as defined above. Preferably R, is N-(C, alkyl)amino or amino. Most preferably R, is amino.

Examples of suitable values for R, include C, alkyl, a C, membered carbocyclic ring 20 and aryl, any of which can be optionally substituted with C, alkyl. Preferably R, is 3-propylbutyl, 2,2 dimethylpropyl, a C_{s-10} membered carbocyclic ring, or aryl. More preferably R, is cyclohexyl, cycloheptyl, adamantyl or aryl. Even more preferably R, is cyclohexyl or aryl. Yet more preferably R, is aryl. Most preferably R, is phenyl.

Examples of suitable values for R₁₀ include C₁₋₄alkyl or a C₃₋₇carbocyclic ring. More 25 preferably R₁₀ is a C₃-7carbocyclic ring or a branched C₁-alkyl chain. Even more preferably R₁₀ is a C₃₋₇carbocyclic ring. Most preferably R₁₀ is cyclohexyl.

Examples of suitable values for R₁₁ include hydrogen, halo, C₁₄alkyl, or C₁₄alkoxy. More preferably R₁₁ is hydrogen or C_{1-a}alkyl. Most preferably R₁₁ is hydrogen.

Examples of suitable values for R_{12} are hydrogen or methyl or when R_{12} is —CH₂—, L_2 is hydrogen and s is 1, R_{12} together with L_2 forms a six membered nitrogen containing ring Preferably R_{12} and L_2 are both hydrogen.

10

Examples of suitable values for R₁₃ are hydrogen or methyl or when R₁₃ is —CH₂—,

5 L₄ is hydrogen and s is 1, R₁₃ together with L₄ forms a six membered nitrogen containing ring

Preferably R₁₃ and L₄ are both hydrogen.

15

Preferably n is 1

Preferably p is 1

Preferably q is 2 - 4. Most preferable q is 4.

20

Preferably r is 1.

10

20

Preferably s is 1.

25

It is to be understood that, insofar as certain of the compounds of Formula (1) defined above may exist in optically active or racemic forms by virtue of one or more asymmetric carbon atoms, the invention includes in its definition any such optically active or racemic

30

15 form which possesses the property of inhibiting MDM2 interactions. The synthesis of optically active forms may be carried out by standard techniques of organic chemistry well known in the art, for example by synthesis from optically active starting materials or by resolution of a racemic form. Similarly, inhibitory properties against MDM2 interactions may be evaluated using the standard laboratory techniques referred to hereinafter.

35

When R_0 is other than R_1 then the following stereo-chemistry is preferred, in the group $-N(L_1)CH((CH_2)_nR_n)CO^{-1}$, in formula (1):

40

45

Formula (X)

A particular group of compounds of the invention include for example, a compound of formula (1) wherein R₅ is hydrogen or C₁₋₄ alkyl, or a pharmaceutically acceptable salt, prodrug or solvate thereof, wherein either:

50

5

10

15

20

25

30

35

40

45

50

(a) R₁ is hydrogen; R₂ is nitro; R₃ is hydrogen; R₄ is indole, N-(C₁₋₄alkyl)indole or cyclohexyl; R₅ is hydrogen or methyl; L₁ is hydrogen and n is 1 or 2; and where the optical centre represented in the Formula (X) is in the S configuration; or

(b) R₁ is halo; R₂ is halo; R₃ is hydrogen; R₄ is indole, N-(C_{1,4}alkyl)indole or cyclohexyl; R₅ is hydrogen or methyl; L₁ is hydrogen and n is 1 or 2; and where the optical centre represented in the Formula (X) is in the S configuration.

A further preferred group of compounds of the invention include, for example a compound of formula (1) wherein R, is R₆C(O)— or R₆CH₂—, or a pharmaceutically acceptable salt, prodrug or solvate thereof, wherein either:

- 10 (a) R₁ is hydrogen; R₂ is nitro; R₃ is hydrogen; R₄ is indole; N-(C₁₋₄alkyl)indole, halo-phenyl or cyclohexyl; R₃ is R₆C(O) or R₆CH₂—; R₆ is substituted phenyl; L₁ is hydrogen or methyl and n is 1 or 2, ; and where the optical centre represented in the Formula (X) is in the S configuration; or
 - (b) R₁ is hydrogen; R₂ is nitro; R₃ is hydrogen; R₄ is indole; N-(C₁₄alkyl)indole; halo-phenyl or cyclohexyl, R, is R₀C(O)- or R₀CH₂-, R₀ is a substituted heterocycle; L₁ is hydrogen or methyl and n is 1 or 2, ; and wherein the optical centre represented in the Formula (X) is in the S configuration.

A further preferred group of compounds of the invention include, for example a compound of formula (1) wherein R_s is $R_sC(O)$ — and R_s is R_s , or a pharmaceutically

- 20 acceptable salt, prodrug or solvate thereof, wherein either:
 - (a) R₁ is hydrogen; R₂ is nitro; R, is hydrogen; R₂ is indole; N₂-(C₁,alkyl)indole; cyclohexyl or halo-phenyl; R, is R₂C(O) -; R₂ is R₂; R, is of formula (2); R₁ is amino; R₂ is an optionally substituted aryl group; R₁₁ is hydrogen; A₁ is oxygen or a bond; n is 1 or 2; p is 1; q is 2-4 and L₁ and L₂ and L₂ are independently hydrogen or methyl; or
- 25 (b) R₁ is hydrogen; R₂ is nitro; R₃ is hydrogen; R₄ is indole; N-(C₁₄alkyl)indole; cyclohexyl or halo-phenyl; R₅ is R₆C(O)-; R₆ is R₇; R₇ is of formula (2); R₆ is amino; R₇ is an optionally substituted heterocyclic group; R₁₁ is hydrogen; A₁ is oxygen or a bond; n is 1 or 2; p is 1; q is 2-4 and L₁ and L₂ and L₃ are independently hydrogen or methyl.

50

A further preferred group of compounds of the invention include, for example a compound of formula (1) wherein R, is R₆CH₂- and R₆ is R₇, or a pharmaceutically acceptable salt, prodrug or solvate thereof, wherein:

(a) R₁ is hydrogen; R₂ is nitro; R₃ is hydrogen; R₄ is indole; N-(C_{1.4}alkyl)indole; cyclohexyl or halo-phenyl; R₃ is R₄CH₂-; R₄ is R₇; R₇ is of formula (3); R₁₀ is either a C_{3.7} carbocyclicring or a C_{1.4}alkyl chain; R₁₁ is hydrogen; L₄ is hydrogen or methyl and r is 1.

A more preferred compound of the invention is a compound of formula (1) wherein R_s is $R_sC(O)$ – and R_s is a substituted phenyl group, or a pharmaceutically acceptable salt, prodrug or solvate thereof, wherein:

R₁ is hydrogen; R₂ is nitro; R₃ is hydrogen; R₄ is indole; N-(C₁₋₁alkyl)indole; or 4-chlorophenyl; R₃ is R₄C(O)-; R₆ is 4,5-dimethoxy-2-nitrophenyl; L₁ is hydrogen or methyl; n is 1 and where the optical centre represented in the Formula (X) is in the S configuration.

A further more preferred compound of the invention is a compound of formula (1) wherein R, is R₆C(O)- and R₆ is R, and R, is of formula (2), or a pharmaceutically acceptable salts, prodrugs or solvates thereof, wherein:

 R_1 is hydrogen; R_2 is nitro; R_3 is hydrogen; R_4 is indole; \underline{N} -(C_{1-} alkyl)indole; phenyl; 4-chloro-phenyl or cyclohexyl; R_3 is R_4 C(O)—; R_4 is R_7 , R_7 is of formula (2); R_4 is amino; A_1 is oxygen or a bond; R_3 is phenyl or cyclohexyl; R_{11} is hydrogen; L_1 , L_2 and L_3 are independently hydrogen or methyl; n is 1; q is 2 - 4 and p is 0-1.

or a pharmaceutically acceptable salt, prodrug or solvate thereof.

A suitable pharmaceutically-acceptable salt of a compound of the Formula (1) is, for example, an acid-addition salt of a compound of the Formula (1) which is sufficiently basic, for example an acid-addition salt with an inorganic or organic acid such as hydrochloric, hydrobromic, sulphuric, trifluoroacetic, citric or maleic acid; or, for example a salt of a compound of the Formula (1) which is sufficiently acidic, for example an alkali or alkaline carth metal salt such as a calcium or magnesium salt, or an ammonium salt, or a salt with an organic base such as methylamine, dimethylamine, trimethylamine, piperidine, morpholine or tris-(2-hydroxyethyl)amine.

Various forms of prodrugs are known in the art, for example in-vivo hydrolysable esters.

In vivo hydrolysable derivatives include, in particular, pharmaceutically acceptable derivatives that may be oxidised or reduced in the human body to produce the parent compound. Such esters can be identified by administering, for example, intravenously to the test animal, the compound under test and subsequently examining the test animal's body fluids. Suitable in vivo hydrolysable esters for hydroxy include acetyl and for carboxyl include, for example, alkyl esters, dialkylaminoalkoxy esters, esters of formula -C(O)-O-CH2C(O)NRa"Rb" where Ra" and Rb" are, for example, selected from hydrogen and C1-4 alkyl, and C1-6alkoxy methyl esters for example methoxymethyl, C1-6alkanoyloxymethyl esters for example pivaloyloxymethyl, phthalidyl esters, C3-8 cycloalkoxycarbonyloxyC1-6alkyl esters for example 1-cyclohexylcarbonyloxyethyl; 1,3-dioxolan-2-ylmethyl esters for example 5-mcthyl-1,3-dioxolan-2-ylmethyl; and C1-6alkoxycarbonyloxyethyl esters for example 1-methoxycarbonyloxyethyl.

- It will also be understood that certain compounds of the present invention may exist in solvated, for example hydrated, as well as unsolvated forms. It is to be understood that the present invention encompasses all such solvated forms which possess the property of inhibiting MDM2 interactions.

In another aspect the present invention provides a process for preparing a compound of the Formula (1) or a pharmaceutically acceptable salt, prodrug or ester thereof which process comprises deprotecting a compound of the Formula (7):

$$\begin{array}{c|c} L_1 & O \\ \hline \\ R_{5'} & N \end{array} \qquad \begin{array}{c} R_{1'} \\ \hline \\ R_{2} \end{array}$$

Formula (7)

- wherein n, L₁ and R₄ are as hereinabove defined and R₁ is R₁ or protected R₁, R₂ is R₂ or protected R₂, R₃ is R₃ or protected R₃ and R₅ is R₅ or protected R₅; wherein at least one protecting group is present; and thereafter if necessary:
 - i) forming a pharmaceutically-acceptable salt,
 - ii) forming a prodrug, and/or
 - iii) forming a solvate.
- 25 Protecting groups may in general be chosen from any of the groups described in the literature or known to the skilled chemist as appropriate for the protection of the group in question, and may be introduced by conventional methods.

- 13 -

5

10

15

20

25

30

35

40

45

50

55

Protecting groups may be removed by any convenient method as described in the literature or known to the skilled chemist as appropriate for the removal of the protecting group in question, such methods being chosen so as to effect removal of the protecting group with minimum disturbance of groups elsewhere in the molecule.

Specific examples of protecting groups are given below for the sake of convenience, in which "lower" signifies that the group to which it is applied preferably has 1-4 carbon atoms. It will be understood that these examples are not exhaustive. Where specific examples of methods for the removal of protecting groups are given below these are similarly not exhaustive. The use of protecting groups and methods of deprotection not specifically mentioned is of course within the scope of the invention.

A carboxy protecting group may be the residue of an ester-forming aliphatic or araliphatic alcohol or of an ester-forming silanol (the said alcohol or silanol preferably containing 1-20 carbon atoms).

Examples of carboxy protecting groups include straight or branched chain C_{1-12} alkyl groups (for example isopropyl, <u>t</u>-butyl); lower alkoxy lower alkyl groups (for example methoxymethyl, ethoxymethyl, isobutoxymethyl); lower aliphatic acyloxy alkyl groups, (for example acetoxymethyl, propionyloxymethyl, butyryloxymethyl, pivaloyloxymethyl); lower alkoxycarbonyloxy lower alkyl group (for example 1-methoxycarbonylethyl, 1-ethoxycarbonylethyl); phenyl lower alkyl groups (for example benzyl, p-methoxybenzyl, <u>o</u>-nitrobenzyl, p-nitrobenzyl, benzhydryl and phthalidyl); tri(lower alkyl)silyl groups (for example trimethylsilyl and <u>t</u>-butyldimethylsilyl); tri(lower alkyl)silyl lower alkyl groups (for example trimethylsilylethyl); and C_{2-6} alkenyl groups (for example allyl and vinylethyl).

Methods particularly appropriate for the removal of carboxy protecting groups include for example acid-, base-, metal- or enzymically-catalysed hydrolysis.

Example of hydroxy protecting groups include lower groups (for example t-butyl), lower alkenyl groups (for example allyl); lower alkanoyl groups (for example acetyl); lower alkoxycarbonyl groups (for example t-butoxycarbonyl); lower alkenyloxycarbonyl groups (for example allyloxycarbonyl); phenyl lower alkoxycarbonyl group (for example benzoyloxycarbonyl, p-methoxybenzyloxycarbonyl, o-nitrobenzyloxycarbonyl, p-nitrobenzyloxycarbonyl); tri lower alkylsilyl (for example trimethylsilyl, t-butyldimethylsilyl) and phenyl lower alkyl (for example benzyl) groups.

10

15

20

25

30

35

40

20

45

50

55

Examples of amino protecting groups include formyl, aralkyl groups (for example benzyl and substituted benzyl, p-methoxybenzyl, nitrobenzyl and 2,4-dimethoxybenzyl, and triphenylmethyl); di-p-anisylmethyl and furylmethyl groups; lower alkoxycarbonyl (for example t-butoxycarbonyl); lower alkenyloxycarbonyl (for example allyloxycarbonyl); phenyl lower alkoxycarbonyl groups (for example benzyloxycarbonyl, p-methoxybenzyloxycarbonyl, o-nitrobenzyloxycarbonyl; trialkylsilyl (for example trimethylsilyl and t-butyldimethylsilyl); alkylidene (for example methylidene); benzylidene and substituted benzylidene groups.

Methods appropriate for removal of hydroxy and amino protecting groups include, for example, acid-, base-, metal- or enzymically-catalysed hydrolysis, for groups such as <u>p</u>-nitrobenzyloxycarbonyl, hydrogenation and for groups such as <u>o</u>-nitrobenzyloxycarbonyl, photolytically.

The reader is referred to Protective Groups in Organic Synthesis 2th Edition, by Green et al, published by John Wiley & Sons for general guidance on protecting groups.

Compounds of the formula (1) and (7) can be formed by:

i) reacting a carboxylic acid of formula (8) or a reactive derivative thereof with a piperazine of formula (9)

$$R_{s}$$
 N
 N
 R_{2}
 R_{3}

Formula (8)

Formula (9)

· wherein L₁, n, R₄, R₁,-R₃, and R₅, are as hereinabove defined.

A suitable reactive derivative of an acid of the Formula III is, for example, an acyl halide, for example an acyl chloride formed by the reaction of the acid and an inorganic acid chloride, for example thionyl chloride; a mixed anhydride, for example an anhydride

10

15

20

25

30

35

40

45

50

formed by the reaction of the acid and a chloroformate such as isobutyl chloroformate; an active ester, for example an ester formed by the reaction of the acid with a phenol such as pentafluorophenol, with an ester such as pentafluorophenyl trifluoroacetate or with an alcohol such as N-hydroxybenzotriazole; an acyl azide, for example an azide formed by the reaction 5 of the acid and an azide such as diphenylphosphoryl azide; an acyl cyanide, for example a ___ cyanide formed by the reaction of an acid and a cyanide such as diethylphosphoryl cyanide; or the product of the reaction of the acid and a carbodiimide such as dicyclohexylcarbodiimide.

The reaction between compounds of the formulae (8) and (9) is carried out under conditions known for peptide bond formation. Typically the reaction is carried out in an 10 organic solvent such as DMF or DMA. A small amount of THF and DMSO may be added as well. The reaction is usually carried out in the presence of an activating agent such as O-(7-azabenzotriazol-1-yl)-1,1,3,3-tetramethyluronium hexafluorophosphate (HATU) and a base, particularly an amine base, for example disopropylethylamine. In addition 1-hydroxy-7-azabenzotriazole (HOAT) may be added as catalyst. The reaction is normally carried out in 15 a temperature range of 0 to 80°C, preferably at around ambient temperature. 2-(1H-Benzotriazol-1yl)-1,1,3,3-tetramethyluroniumhexafluorophosphate (HBTU), may be used instead of HATU in which case 1-hydroxy-benzotriazole (HOBt) is generally used as catalyst.

The compound of the formula (8) is conveniently prepared by solid phase organic synthesis on a polymer resin. The resin is preferably one that can be removed with mild acid 20 such as chlorotritylchloride resin. For example of other suitable polystyrene resins see the Nova Biochem Combinatorial Chemistry Catalogue February 1997.

The synthesis of a compound of the formula (8) is normally started with an amino acid which has a -(CII₂)_eR₄ side chain. The amino acid functional groups not taking part in the reaction are protected by various functional groups. For example, the N-terminal and side 25 chain amino groups may be protected by using 9-fluoroenylmethoxycarbonyl (Fmoc), t-butoxycarbonyl (Boc), biphenylisopropoxycarbonyl (Bpoc), 2-[3,5dimethoxyphenyl]propyl-2-oxycarbonyl (Ddz), adamantyloxycarbonyl (Adoc), allyloxycarbonyl (Aloc), 2,2,2-trichlorocthoxycarbonyl (Troc), benzyloxycarbonyl and various substituted benzyloxycarbonyl groups. These protected groups can be cleaved when 30 required by the standard techniques (e.g. acid or base treatment, catalytic hydrogenolysis and Pd(0) treatment or zinc/acetic acid treatment). The choice of protecting group depends to a

10

15

20

10

25

30

35

40

45

50

55

large extent on the type of resin used. When the resin is chlorotritylchoride the preferred amino protecting group is Fmoc.

The protected amino acid is then mixed with the resin so that its reacts with the resin through its carboxy group. When the resin is chlorotrityl resin, the reaction between amino acid and resin is conventionally carried out in an organic solvent such as DMF in the presence of a base such as DIPEA. The amino-protecting group is then removed so that the R⁵ can be introduced if it is other than hydrogen. The protecting group cleavage reactions can be performed at temperatures in the range of 4°C to 40°C (preferably at or about ambient temperature) and over a period of time in the range of 10 minutes to 24 hours.

The introduction of the R_s group when R_s is of the formula $R_sC(O)$ - is carried out using standard methods known for the formation of an amide bond. For example in the presence of HBTU as described above.

When R₆ is of the formula R₇ the group R₆CO- can gradually be built up with subsequent amide bond forming reactions. For example the group NH(L₂)-CH(CH₂Ph)-CO15 may be introduced onto the amino acid attached to the resin by reacting a compound of the formula PN(L₂)-CH(CH₂Ph)COOH (wherein P is an amino-protecting group), with the latter compound under amide bond-forming conditions. The amino-protecting group can then be removed and the resulting compound reacted with a compound of the formula PN(L₃)CH((CH₂)₀R₈)COOH under similar conditions. Again the amino-protecting group can be removed and the resulting compound reacted with a compound of the formula R₅(CH₂)_pA₁-COOH. Alternatively the group R₇COOH could be formed itself through subsequent amide-bond forming reactions and then introduced in one step onto the amino acid that is attached to the resin.

The resin is then removed, which in the case of chlorotrityl resin involves treating it with acetic acid and trifluoroethanol, to give a compound of the formula (8).

For further information on the formation of amide bonds see the procedures disclosed in "Solid Phase Peptide Synthesis: A practical approach" by Atherton and Sheppard (published by IRL press at Oxford University Press, 1989). "Solid Phase Peptide Synthesis" by Stewart and Young (published by the Pierce Chemical Company, Illinois, 1984),

30 "Principles of Peptide Synthesis" (published by Springer-Verlag, Berlin, 1984), and a series

5

10

20

25

30

35

40

45

50

55

of books "Amino Acids, Peptides and Proteins" (volumes 1-25; volume 25 published in 1994) (published by the Royal Society of Chemistry, Cambridge, UK).

Similar reaction conditions can be used to synthesise a compound of the (8) without using a resin support.

When R5 is of the formula R6CH2-, a compound of the formula (8) may be prepared by reacting together a compound of the formula R₆C(O)H and the appropriate amine under conditions known for the formation of a Schiff's base, followed by reduction of the Schiff's base to the methylamino group. The reaction is typically carried out in an organic solvent such as DMF or an alcohol such as methanol or ethanol. Suitable reducing agents include 10 sodium trisacetoxyborohydride, sodium cyanoborohydride and sodium borohydride.

A compound of the formula (9) is conveniently prepared by reacting piperazine, in which one nitrogen is protected, with a group of the formula:

$$L_{4} \underbrace{\hspace{1cm}}^{R_{1}}_{R_{2}}$$

wherein L₄ is a leaving group and R₁₁ - R₃, are as hereinabove defined. Preferably the leaving 15 group is chloro. The reaction is generally carried out in an inert organic solvent such as tolucne or methylformamide, in the presence of an organic base such as triethylamine or DBU, in a temperature range of 80-200°C, preferably at reflux.

Optional substituents in a compound of the formula (1) or (7) or intermediates in their preparation may be converted into other optional substituents. For example an hydroxy group 20 could be alkylated to a methoxy group.

Various substituents may be introduced into compounds of the formulae (1) or (7) and intermediates in this preparation, when appropriate, using standard methods known in the art. For example, an acyl group or alkyl group may be introduced into an activated benzene ring using Friedel-Crafts reactions, a nitro group by nitration with concentrated nitric acid and 25 concentrated sulphuric acid and bromination with bromine or tetra(n-butyl)ammonium tribromide.

It will be appreciated that, in certain steps in the reaction sequence to compounds of the formula (1), it will be necessary to protect certain functional groups in intermediates in

10

15

20

25

30

35

40

45

50

order to prevent side reactions. Deprotection may be carried out at a convenient stage in the reaction sequence once protection is no longer required.

In order to use a compound of the Formula (1), or a pharmaceutically-acceptable salt or in vivo cleavable ester thereof, for the therapeutic treatment (including prophylactic treatment) of mammals including humans, it is normally formulated in accordance with __ standard pharmaceutical practice as a pharmaceutical composition.

According to this aspect of the invention there is provided a pharmaceutical composition which comprises an amide derivative of the Formula (1), or a pharmaceutically-acceptable or in vivo cleavable ester thereof, as defined herein before in association with a pharmaceutically-acceptable diluent or carrier.

The compositions of the invention may be in a form suitable for oral use (for example as tablets, lozenges, hard or soft capsules, aqueous or oily suspensions, emulsions, dispersible powders or granules, syrups or elixirs), for topical use (for example as creams, ointments, gels, or aqueous or oily solutions or suspensions), for administration by inhalation (for example as a finely divided powder or a liquid aerosol), for administration by insufflation (for example as a finely divided powder) or for parenteral administration (for example as a sterile aqueous or oily solution for intravenous, subcutaneous, intramuscular or intramuscular dosing or as a suppository for rectal dosing).

The compositions of the invention may be obtained by conventional procedures using conventional pharmaceutical excipients, well known in the art. Thus, compositions intended for oral use may contain, for example, one or more colouring, sweetening, flavouring and/or preservative agents.

Suitable pharmaceutically-acceptable excipients for a tablet formulation include, for example, inert diluents such as lactose, sodium carbonate, calcium phosphate or calcium 25 carbonate, granulating and disintegrating agents such as corn starch or algenic acid; binding agents such as starch; lubricating agents such as magnesium stearate, stearic acid or talc; preservative agents such as ethyl or propyl p-hydroxybenzoate, and anti-oxidants, such as ascorbic acid. Tablet formulations may be uncoated or coated either to modify their disintegration and the subsequent absorption of the active ingredient within the 30 gastrointestinal tract, or to improve their stability and/or appearance, in either case, using conventional coating agents and procedures well known in the art.

30

35

40

45

50

55

30

Compositions for oral use may be in the form of hard gelatin capsules in which the active ingredient is mixed with an inert solid diluent, for example, calcium carbonate, calcium phosphate or kaolin, or as soft gelatin capsules in which the active ingredient is mixed with water or an oil such as peanut oil, liquid paraffin, or olive oil.

Aqueous suspensions generally contain the active ingredient in finely powdered form together with one or more suspending agents, such as sodium carboxymethylcellulose, methylcellulose, hydroxypropylmethylcellulose, sodium alginate, polyvinyl-pyrrolidone, gum tragacanth and gum acacia; dispersing or wetting agents such as lecithin or condensation products of an alkylene oxide with fatty acids (for example polyoxethylene stearate), or 10 condensation products of ethylene oxide with long chain aliphatic alcohols, for example heptadecaethyleneoxycetanol, or condensation products of ethylene oxide with partial esters derived from fatty acids and a hexitol such as polyoxyethylene sorbitol monooleate, or condensation products of ethylene oxide with partial esters derived from fatty acids and hexitol anhydrides, for example polyethylene sorbitan monooleate. The aqueous suspensions 15 may also contain one or more preservatives (such as cthyl or propyl p-hydroxybenzoate, antioxidants (such as ascorbic acid), colouring agents, flavouring agents, and/or sweetening agents (such as sucrose, saccharine or aspartame).

Oily suspensions may be formulated by suspending the active ingredient in a vegetable oil (such as arachis oil, olive oil, sesame oil or coconut oil) or in a mineral oil (such as liquid 20 paraffin). The oily suspensions may also contain a thickening agent such as beeswax, hard paraffin or cetyl alcohol. Sweetening agents such as those set out above, and flavouring agents may be added to provide a palatable oral preparation. These compositions may be preserved by the addition of an anti-oxidant such as ascorbic acid.

Dispersible powders and granules suitable for preparation of an aqueous suspension by 25 the addition of water generally contain the active ingredient together with a dispersing or wetting agent, suspending agent and one or more preservatives. Suitable dispersing or wetting agents and suspending agents are exemplified by those already mentioned above. Additional excipients such as sweetening, flavouring and colouring agents, may also be present.

The pharmaceutical compositions of the invention may also be in the form of oil-in-water emulsions. The oily phase may be a vegetable oil, such as olive oil or arachis oil,

10

15

20

25

30

35

40

25

45

50

or a mineral oil, such as for example liquid paraffin or a mixture of any of these. Suitable emulsifying agents may be, for example, naturally-occurring gums such as gum acacia or gum tragacanth, naturally-occurring phosphatides such as soya bean, lecithin, an esters or partial esters derived from fatty acids and hexitol anhydrides (for example sorbitan monooleate) and 5 condensation products of the said partial esters with ethylene oxide such as polyoxyethylene sorbitan monooleate. The emulsions may also contain sweetening, flavouring and preservative agents.

Syrups and elixirs may be formulated with sweetening agents such as glycerol, propylene glycol, sorbitol, aspartame or sucrose, and may also contain a demulcent, 10 preservative, flavouring and/or colouring agent.

The pharmaceutical compositions may also be in the form of a sterile injectable aqueous or oily suspension, which may be formulated according to known procedures using one or more of the appropriate dispersing or wetting agents and suspending agents, which have been mentioned above. A sterile injectable preparation may also be a sterile injectable 15 solution or suspension in a non-toxic parenterally-acceptable diluent or solvent, for example a solution in 1,3-butanediol.

Suppository formulations may be prepared by mixing the active ingredient with a suitable non-irritating excipient which is solid at ordinary temperatures but liquid at the rectal temperature and will therefore melt in the rectum to release the drug. Suitable excipients 20 include, for example, cocoa butter and polyethylene glycols.

Topical formulations, such as creams, ointments, gels and aqueous or oily solutions or suspensions, may generally be obtained by formulating an active ingredient with a conventional, topically acceptable, vehicle or diluent using conventional procedures well known in the art.

Compositions for administration by insufflation may be in the form of a finely divided powder containing particles of average diameter of, for example, 30µm or much less, the powder itself comprising either active ingredient alone or diluted with one or more physiologically acceptable carriers such as lactose. The powder for insufflation is then conveniently retained in a capsule containing, for example, 1 to 50mg of active ingredient for 30 use with a turbo-inhaler device, such as is used for insufflation of the known agent sodium cromoglycate.

Compositions for administration by inhalation may be in the form of a conventional pressurised aerosol arranged to dispense the active ingredient either as an aerosol containing finely divided solid or liquid droplets. Conventional aerosol propellants such as volatile fluorinated hydrocarbons or hydrocarbons may be used and the aerosol device is conveniently arranged to dispense a metered quantity of active ingredient.

For further information on Formulation the reader is referred to Chapter 25.2 in Volume 5 of Comprehensive Medicinal Chemistry (Corwin Hansch; Chairman of Editorial Board), Pergamon Press 1990.

The amount of active ingredient that is combined with one or more excipients to

10 produce a single dosage form will necessarily vary depending upon the host treated and the
particular route of administration. For example, a formulation intended for oral
administration to humans will generally contain, for example, from 0.5 mg to 2 g of active
agent compounded with an appropriate and convenient amount of excipients which may vary
from about 5 to about 98 percent by weight of the total composition. Dosage unit forms will

15 generally contain about 1 mg to about 500 mg of an active ingredient. For further information
on Routes of Administration and Dosage Regimes the reader is referred to Chapter 25.3 in
Volume 5 of Comprehensive Medicinal Chemistry (Corwin Hansch; Chairman of Editorial
Board), Pergamon Press 1990.

The size of the dose for therapeutic or prophylactic purposes of a compound of the

20 Formula (1) will naturally vary according to the nature and severity of the conditions, the age
and sex of the animal or patient and the route of administration, according to well known
principles of medicine.

In using a compound of the Formula (1) for therapeutic or prophylactic purposes it will generally be administered so that a daily dose in the range, for example, 0.5 mg to 75 mg per kg body weight is received, given if required in divided doses. In general lower doses will be administered when a parenteral route is employed. Thus, for example, for intravenous administration, a dose in the range, for example, 0.5 mg to 30 mg per kg body weight will generally be used. Similarly, for administration by inhalation, a dose in the range, for example, 0.5 mg to 25 mg per kg body weight will be used. Oral administration is however preferred, particularly in tablet form. Typically, unit dosage forms will contain about 1 mg to 500 mg of a compound of this invention.

50

The compounds of this invention may be used in combination with other drugs and therapies used in the treatment of disease states which would benefit from the inhibition of the interaction of p53 and MDM2. For example, the compounds of the Formula (1) could be used in combination with drugs and therapies used in the treatment of cancers, including, but not 5 limited to, breast cancer, sarcomas, osteosarcoma, testicular cancer or oesophageal cancer.

If formulated as a fixed dose such combination products employ the compounds of this invention within the dosage range described herein and the other pharmaceutically-active agent within its approved dosage range. Sequential use is contemplated when a combination formulation is inappropriate.

Although the compounds of the Formula (1) are primarily of value as therapeutic agents for use in warm-blooded animals (including man), they are also useful whenever it is required to inhibit the interaction of p53 and MDM2. Thus, they are useful as pharmacological standards for use in the development of new biological tests and in the search for new pharmacological agents.

In a further aspect of the invention there is provided a method of probing the biochemistry of MDM2 interactions using a compound of formula (1).

In a further aspect of the invention there is provided for use in the treatment of a warm-blooded animal, by therapy, a compound of formula (1), or a pharmaceutically acceptable salt, prodrug or solvate thereof as herein defined.

In a further aspect of the invention there is provided a method of treating cancers which comprises administering to a warm-blooded animal an effective amount of a compound of formula (4),

R₆CH₂-; or a pharmaceutically acceptable salt, prodrug or solvate thereof.

In a further aspect of the invention there is provided a method of treating cancers, mediated by wild type or altered MDM2, which comprises administering to a warm-blooded animal an effective amount of a compound of formula (4), or a pharmaceutically acceptable salt, prodrug or solvate thereof as herein defined.

In a further aspect of the invention there is provided the use of a compound of

formula (4) or a pharmaceutically acceptable salt, prodrug or solvate thereof as herein defined,
in the manufacture of a medicament for use in the treatment of cancer.

In a further aspect of the invention there is provided the use of a compound of formula (4) or a pharmaceutically acceptable salt, prodrug or solvate thereof as herein defined, in the manufacture of a medicament for use in the treatment of cancer, mediated by wild type or altered MDM2.

In a further aspect of the invention there is provided the use of a compound of formula (4) or a pharmaceutically acceptable salt, prodrug or solvate thereof as herein defined in the manufacture of a medicament for the treatment of cancer in a warm-blooded animal.

In a further aspect of the invention there is provided the use of a compound of 30 formula (4) or a pharmaceutically acceptable salt, prodrug or solvate thereof as herein defined - 25 -

in the manufacture of a medicament for the treatment of cancers, mediated by wild-type or altered MDM2, in a warm-blooded animal.

In a further aspect of the invention there is provided a pharmaceutical composition comprising a compound of formula (4), or a pharmaceutically acceptable salt, prodrug or solvate thereof as herein defined, in admixture with a pharmaceutically-acceptable diluent or carrier for the treatment of cancer in a warm-blooded animal.

In a further aspect of the invention there is provided a pharmaceutical composition comprising a compound of formula (4), or a pharmaceutically acceptable salt, prodrug or solvate thereof, in admixture with a pharmaceutically-acceptable diluent or carrier for the treatment of cancer, mediated by wild-type or altered MDM2, in a warm-blooded animal.

The following biological assay provides a method of measuring the inhibition of the interaction of p53 with MDM2.

Biological Assays

15 Measurement of the inhibition of p53 / MDM2 interaction

The inhibition of the p53 / MDM2 interaction by compounds was measured using a modified ELISA assay using a histidine tagged MDM2 [MDM2 (1-118) 6 his], a p53 GST fusion protein (GST-p53) and a nickel chelate - alkaline phosphatase (NTA-AP).

The human MDM2 N-terminal fragment encompassing amino acids 1-118 and
immediately followed by a C-terminal 6-histidine tag sequence and then a stop codon was
generated by PCR from a human placental cDNA library. The PCR product was initially
cloned into pCR2.1 vector (Invitrogen) following the manufacturers protocol. DNA
sequencing confirmed a MDM fragment sequence identical to that to of published MDM2
(EMBL accession no. Z12020). The MDM2-6His fragment was then suncloned into pTB375
E coli expression vector to produce the expression vector pTB375-MDM2-6His (1-118)
clone no. 11. The pTB375 vector is a modified T7 (Studier) Expression vector. Expression
grows were performed in E.coli strain BL21 / DE3 (obtained from Novagen Inc.) and
expression of the recombinant protein was induced by addition of IPTG (isopropyl-β-D-1thiogalactopyranoside). MDM2 (1-118) 6 his was purified from E.coli lysates using Ni-NTA

30 beads (Qiagen).

50

5

10

15

20

25

30

35

40

The background vector for generation of pTB375 was pZEN0042 (pICI0042),

5

10

15

20

25

30

35

40

45

described fully in UK patent application GB 2253852. Briefly, pZEN0042 contains the tetA/tetR inducible tetracycline resistance sequence from plasmid RP4 and the cer stability sequence from plasmid pKS492 in a pAT153 derived background. pTB375 was generated by the addition of an expression cassette consisting of the T7 gene 10 promoter, multiple cloning site and T7 gene 10 termination sequence. In addition, a terminator sequence designed to reduce transcriptional readthrough from the background vector was included upstream of the expression cassette.

A DNA fragment encoding aa1-50 of p53 followed by a stop codon was generated by

10 PCR using vector pHp53B (ATCC clone no. 57255) as template. The PCR product was initially cloned into pCR2.1 vector (Invitrogen) following the manufacturers protocol. DNA sequencing confirmed a p53 sequence identical to that to of published p53 (EMBL accession no. X04269).

The p53 fragment was then subcloned into pGEX-4T1 E coli expression vector (Pharmacia) to produce the expression vector pGEX-4T1-p53(1-50) clone no. 7.

The sequence of the expression vector at the junction of the GST and p53 sequences was as follows:

GST seq.....CTG GTT CCG CGT GGA TCC ATG.......

(ATG is aa1 of p53, GGA TCC is the conserved BamHI cloning site)

- Expression grows were performed in E.coli strain DH5alpha and expression of the recombinant protein was induced by addition of IPTG. GST-p53(1-50) was purified using glutathione -sepharose beads (Pharmacia). The procedures used for expressing the GST fusion protein are therefore analogous procedures to those disclosed by J. Han et al., Journal of Biological Chemistry, 1996, 271, 2886-2891.
- In the assay the following solutions were used:

Stock GST-p53 (6.1mg/ml / ~200uM) diluted 2706 fold using H₂O; Stock MDM2-6His (1.1mg/ml, ~70uM) diluted 933 fold using H₂O;

10

20

25

30

35

40

45

50

Stock NTA-AP was made by reconstituting lyophilised Ni-NTA-AP (Qiagen 34510 - 200µg) in 500ul distilled water and stored as frozen aliquots. It was frehly diluted 1:1000 using phosphate buffered saline (PBS) for use in the assay;

PNPP buffer - 100mM Tris HCl, pH 9.5, 100mM NaCl, 5mM MgCl;

5 2.5mM Phosphatase substrate (Sigma 104 phosphatase substrate) was dissolved in PNPP buffer approximately 20 minutes prior to use; it was kept in the dark;

Double distilled water was used throughout the assay.

100μl of 75nM GST-p53 was added per well to a 96 well plate (Nunc Maxisorp) and the plate left at 4°C overnight. Next day the fluid in the wells was removed and discarded and 10 100μl 0.2% bovine serum albumin (BSA) in PBS was added to each well and left at room temperature for 1 hour. The fluid was then removed and discarded and each well was washed twice with 0.1% Tween in PBS. After removing and discarding the second tween/PBS wash, 10μl of compound was added to each well, followed by 90μl 75nM MDM2-6His. The plate was then incubated at room temperature for 1.5 hours. After this time the fluid from each well was removed and discarded and each well was washed three times with 280μl Tween/PBS. After removing and discarding the final wash, 100μl NTA-AP was added to each well and the plate incubated at room temperature for 1.5 hours. After this time the fluid from each well was removed and discarded and each well was washed three times with 280μl Tween/PBS. Next 100μl phosphatase substrate in PNPP buffer was added and the plate left for 1-2 hours at 30°C. The optical density of each well was measured at 405nm.

Compounds were tested at a final concentration between 0 and $100\mu M$. Stock solutions of compound were made at $30\mu M$ in DMSO, dilutions were made in H_2O .

Although the pharmacological properties of the compounds of the Formula (1) vary with structural change as expected, in general compounds of the Formula (1) possess an IC50

25 in the above test in the range, for example, 0.03 to 200μM. Thus by way of example the compound of Example 9 herein has an IC₅₀ of approximately 4μM.

The invention will now be illustrated by the following non-limiting Examples in which, unless otherwise stated:-

(i) concentrations and evaporations were carried out by rotary evaporation in vacuo;

(ii) operations were carried out at room temperature, that is in the range 18-26°C;
(iii) yields, when given, are intended for the assistance of the reader only and are not

necessarily the maximum attainable by diligent process development;

10

(iv) the following abbreviations are used:

15

5 BOC = tert-butoxycarbonyl; Cha = is an amino acid residue with a cyclohexylmethyl side_chain; Dab = is an amino acid residue with a 2-aminoethyl side chain; DBU = 1,8-diazabicyclo[5.4.0]undec-7-ene; DMF = N,N-dimethylformamide; HOBt = 1-hydroxy-benzotriazole; Met = methionine; Fmoc = 9-fluorenylmethyloxycarbonyl; THF = tetrahydrofuran; DMSO = dimethylsulfoxide; HATU = O-(7-azabenzotriazol-1-yl)-1,1,3,3-

- 28 -

20

Example 1

Z-NMe(D)Dab-NMe(D)Phe-(D)Phe(4-C1)-piperazine-4-nitrophenyl

Z-NMc(D)Dab(BOC)-NMe(D)Phe-(D)Phe(4-Cl)-OH (assuming 0.25mmol) was dissolved in DMF(1ml). 4-Nitrophenyl-piperazine (1.2eq, 15.5mg), HATU(1eq, 19mg) and DIPEΛ(3.6eq, 157μl) were added and the mixture was stirred overnight at ambient temperature. RP-HPLC indicated that the reaction was 50% complete. It was evaporated to dryness and the BOC group removed by treatment with TFA/TIPS/water 10:1:1 (6ml, 5:0.5:0.5).

The resulting peptide was purified by preparative RP-IPLC (Vydac C18 218TP1022 column cluting with an acetonitrile - water system containing 0.1%TFA (5 to 60% acetonitrile over 80 minutes), flow rate 12ml/min). The fractions containing the product were combined and lyophilised to give Z-NMc(D)Dab-NMe(D)Phe-(D)Phe(4-Cl)-piperazine-4-nitrophenyl, 6.5mg(3.25% yield).

15 The product was characterised by HPLC and mass spectrometry:

RP- HPLC Vydac C18 218TP54 4.6x250mm column eluting at 1.2ml/min in water and acetonitrile containing 0.1%TFA (30-70% acetonitrile over 20 minutes) retention time 15.27 minutes, no detectable impurities, mass spectrometry, m/e (positive electrospray, (ES+)) 798.5, 799.1, 800.5 (MH+).

The starting material was prepared by solid phase synthesis starting with Wang Resin in a Bond Elut (Varian 25ml, fitted with a filter in the bottom):

Wang Resin(Novabiochem,1.28g) was stirred in dichloromethane (15ml)with MSNT (ref. Birgt Blankeymeyer-Menge, *Tet Lett.* 1990, 31, 1701)(2mmol, 592mg) and Fmoc-Phe(4-Cl)-OH (2mmol, 845mg) for 45 minutes. The resin was washed with dichloromethane

25 with DMF (5x10ml).

30

5

5

(3x10ml) then methanol (3x10ml). The resin was dried *in vacuo* at 40°C overnight. Weight gain indicated a loading of 0.59mmol/g for Fmoc(D)Phe(4-Cl)-Wang Resin.

10

The Fmoc group was removed with 20% piperidine in DMF (3x10min, 10 ml each time) to give H-(D)Phe(4-Cl)-Wang Resin.

15

H-(D)Phe(4-Cl) -Wang Resin (423mg ~0.25mmol) was placed in another Bond Elut (15ml). FmocNMe(D)Phe-OH(3eq, 301mg) was dissolved in DMF(1.5ml), HBTU (3eq, 284mg) and DIPEA (9eq) were added. After 5 minutes this mixture was added to the resin and stirred for 1-1.5h at ambient temperature. The resin was then washed with DMF (3x10ml).

20

The Fmoc group was removed with 20% piperidine in DMF (3x10min, 10 ml each time) to give NMc(D)Phe-(D)Phe(4-Cl)-Wang Resin.

Fmoc-Dab(BOC)-OH (3eq, 340mg) was coupled to the N-terminus of NMe(D)Phe(D)-Phe(4-Cl)-Wang Resin using a similar method to the coupling of Fmoc-Phe(4-Cl)-OH, except HATU(3eq, 285mg) was used instead of HBTU, to give Fmoc-

25

15 Dab(BOC)NMe(D)Phe-(D)Phe(4-Cl)-Wang Resin.

30

The Fmoc group was removed with 20% piperidine in DMF (3x10min, 10 ml each time) to give Dab(BOC)-NMe(D)Phe-(D)Phe(4-Cl)-Wang Resin.

35

The resin was washed with DMF(3x10ml) and suspended in dichloromethane (5ml) to which was added 2-nitrobenzenesulfonyl chloride (3eq, 166mg) and 2,4,6-collidine (5eq,

40

20 165μl). After 2 hours the resin was washed with dichloromethane (3x5ml) and suspended in DMF (5ml). To this was added MTBD (ref. Miller, J. Am. Chem. Soc., 1997, 119,2301)(2-4eq, 100μl) and methyl-4-nitrobenzene sulfonate (3-5eq, 200mg). After 30 minutes the resin was washed with DMF (3x5ml) and the resin suspended in DMF (5ml). DBU (5eq, 187μl) and mercaptoethanol (10eq, 175μl) were added and after 30 minutes the resin was washed

45

The resin was wet with DMF (1-2ml) and benzoyl chloroformate (4eq, 170mg) and DIPEA (12cq, 0.52ml) added. After 1.5 hours the resin was washed with DMF (3x10ml) and then methanol (3x10ml). The resin was dried once more *in vacuo* overnight to give Z-NMe-(D)Dab-NMe(D)Phe-(D)Phe(4-Cl)-Wang resin.

50

Z-NMeDab-NMe(D)Phe-(D)Phe(4-Cl)-OH was cleaved from the resin by addition of TFA:TIPS:water (10:1:1, 12ml). The resin was filtered and washed thoroughly with

The BOC group was reintroduced on to Z-NMeDab-NMe(D)Phe-(D)Phe(4-Cl)-OH

5

TFA(3x5ml) and the solution was evaporated to dryness and lyopholised from water to yield an oil.

10

(assuming 0.25mmol) by treating it with di t-butyl-dicarbonate(4eq) in DMF (1-2ml) and

5 DIPEA(12ml). RP-HPLC indicated that the reaction was complete after 1h (Vydac C18 __
218TP54 4.6x250mm acetonitrile - water system containing 0.1%TFA, 10-90% acetonitrile
over 20minutes, flow 1.2ml/min). The solution was evaporated to dryness and washed with
1M Citric acid (2x5ml) then hexane(2x5ml). It was dried *in vacuo* overnight in the presence

10 oil.

Mass spectrometry m/e (Positive 5 electrospray (ES+)) 759.7, 761, 761.9 (MH+)

The starting material was synthesised on an ABI 430 Automated Peptide Synthesiser starting from 2-chlorotritylchloride resin(Alexis, 188mg, 0.25mmol).

Fmoc Cha-OH (1mmol each time) was double coupled to the chlorotrityl chloride resin in the standard way using, dichloromethane (5ml each time) with diisopropylamine (2eq, 10 348µl each time) to give Fmoc-Cha-resin.

Fmoc was removed using a similar method to that used in example 1 but using 5ml of piperidine in DMF each time.

Fmoc-NMe(D)Phe-OH (1mmol, 401mg) was coupled to Cha-resin using HBTU (1mmol, 379mg) and HOBT (1mmol, 135mg) in DMF with DIPEA (2mmol, 378µl), for 1 hour at ambient temperature. The resin was washed thoroughly with dichloromethane (5x5ml) to give Fmoc-(D)NMe Ph-Cha-resin. Fmoc was removed using a similar method to that described in example 1.

Fmoc-Lys(BOC)-OH (1mmol, 468mg) was coupled to NMe(D)Ph-Cha-resin using HATU (1mmol, 380mg) in DMF with DIPEA (2mmol, 348µl), at ambient temperature for 1 20 hour. The resin was washed thoroughly with DMF (5x5ml). Fmoc was removed using a similar method to that described in example 1.

Cyclohexanccarboxylic acid (1mmol, 128mg) was coupled to the peptide resin using a similar method to that used for the incorporation of Fmoc-NMe(D)Phe-OH. The peptide was cleaved from the resin using a mixture of acetic acid, trichloroethane and

25 dichloromethane(14ml 2:2:10) for 2h. The resin was filtered and washed thoroughly with acetic acid:dichloromethane (1:4). The filtrate was evaporated to dryness and taken up in water and finally lyophilised to give cyclohexyl-CO-(D) Lys-(BOC)NMe(D)Phe-Cha-resin.

Example 4

Cyclohexyl-(D)LysNMe(D)Phe-(D)Phe(4-Cl)-piperazine-3,4-dichlorophenyl

HATU (39mg, 0.1mmol) was added to a stirred solution of cyclohexyl-(D)Lys(BOC)-

- 5 NMe(D)Phe(4-Cl)-OH (70mg, 0.1mmol), diisopropylethylamine (70μl, 4 equivalents) and dichlorophenyl piperazine (24mg, 0.1mmol) in DMF (4ml). After 1 hour at ambient temperature, RP-HPLC indicated that most of the acid had been consumed and a new peak, retention time 30.58 minutes (column and gradient as described at the bottom of this example) had been formed. The solvent was evaporated in vacuo, and the residue was dissolved in a
- 10 mixture of TFA (9ml), water (1ml) and triethylsilane (0.3ml). After 1 hour at ambient temperature, excess reagents were evaporated and the crude product now dissolved in acetonitrile (2ml) and water (2ml) for analytical and preparative RP-HPLC. The crude product was purified using preparative RP-HPLC (Dynamax C18, 1 inch internal diameter), using a gradient of acetonitrile-water containing 0.1% TFA (20-90% acetonitrile) over 60
- minutes at a flow-rate of 12ml/minute. Fractions which contained the title product (eluting at
 minutes) were combined and freeze-dried. Yield 69.6mg.

The product was characterised by HPLC, mass spectroscopy and amino-acid analysis. RP-HPLC Vydac C18 column, 201HS54, 4.6x250mm, eluting with acetonitrile and

water containing 0.1% TFA, using a 20-60% acetonitrile gradient over 30 minutes, flow rate

20 1.2ml/minutc, retention time 22.15 minutes, no detectable impurities; mass spectrometry, m/e (positive electrospray (ES+)) 811.4 (MH+); amino acid analysis (acid hydrolysis over 24 hours using a solution of 6N HCl containing 1% phenol at 130°C) gave Phe(4-Cl) 0.84, Lys 1.00.

The starting material was prepared as follows:

Fmoc-(D)Phe(4-Cl)-OH (844mg, 2mmol) was coupled to 2-chlorotritylchloride resin (Alexis, 0.75g, 1mmol) in the presence of diisopropylethylamine (2mmol 0.35ml) in DMF (8ml) by an automated procedure on an Applied Biosystems 430A peptide synthesiser. After 1 hour at ambient temperature, the resin was filtered and washed with DMF. After

- 5 deprotection with 20% piperidine in DMF (two treatments with 15ml), the resin was thoroughly washed with DMF (5x10ml). Fmoc-NMe(D)Phe-OH (803mg, 2mmol) was coupled to the resin-bound H-(D)Phe(4-Cl) by the standard HBTU/HOBt chemistry similar to that used in example 3. After extensive washing with DMF, the deprotection procedure described above was repeated to give H-NMe(D)Phe-(D)Phe(4-Cl)-resin. Fmoc-
- 10 (D)Lys(BOC)-OH (938mg, 2mmol) was coupled by the HATU procedure (see J Chem Soc. Chem Comm. 1994, 201). After 1 hour at ambient temperature the resin as filtered and washed with DMF. After deprotection and extensive washing with DMF, cyclohexane carboxylic acid (256mg, 2mmol) was coupled by standard HBTU/HOBt chemistry similar to that described above to the resin bound tripeptide to give cyclohexyl-(D)Lys(BOC)-
- 15 NMe(D)Phe-(D)Phe(4-Cl) on the resin. The peptide resin was collected and washed with methanol and dried, in vacuo, at 50°C. Yield 1.337g (gain 587mg).

The peptide was cleaved from the resin using a mixture of dichloromethane (20ml), trifluoroethanol (4ml) and acetic acid (4ml) at ambient temperature. After 2 hours, the mixture was filtered and the resin was washed with a mixture of acetic acid in

20 dichloromethane (5%) (5x20ml). The combined filtrate and washes were evaporated to dryness and the residue was dissolved in a mixture of acetonitrile (100ml) and water (50ml) for analytical RP-HPLC and lyophilisation. Yield 604mg (86%).

RP-HPLC Vydac C18 column, 201HS54, 4.6x250mm, eluting with acetonitrile and water containing 0.1% TFA, using a 20-80% acetonitrile gradient over 40 minutes, flow rate

1.2ml/minute, indicated 100% purity, retention time 22.05 minutes no detectable impurities.

Adamantylacetyl-(D)Lys-NMe(D)Phe-(D)Trp-piperazine-4-nitrophenyl

Adamantylacetyl-(D)Lys(BOC)-NMe(D)Phe-(D)Trp-OH (77mg, 0.1mmol) was coupled to 4-(nitrophenzyl)piperazine (21mg, 0.1mmol) by a similar procedure to that described in example 4. Analytical RP-HPLC (column and conditions as for the protected peptide acid below) indicated almost complete conversion to the amide, retention time 23.39 minutes. After deprotection with TFA and scavengers (water and triisopropylsilane), the crude product was purified by preparative RP-HPLC (Dynamax C18, 1 inch internal diameter using a gradient of acetonitrile-water containing 0.1% TFA (20-70% acetonitrile) over 60 minutes at a flow rate of 12ml/minute. Fractions which contained the pure title product (eluting at 55 minutes) were combined and freeze dried. Yield 43mg.

The product was characterised by IHPLC and mass spectroscopy. RP-HPLC (column and conditions exactly as for previous example) indicated 100% purity, retention time 19.66 minutes; mass spectrometry m/e (positive electrospray (ES⁺)) 859.6 (MH⁺).

The starting material was prepared as follows:

Adamantylacetyl-(D)Lys(BOC)-NMe(D)Phe-(D)Trp-OH was prepared by a similar method to that described in example 4, but on a smaller scale (0.4mmol). Yield 186mg 20 (60%).

RP-HPLC Vydac C18 column, 201HS54, 4.6x250mm, eluting with acetonitrile and water containing 0.1% TFA, using a 25-90% acetonitrile gradient over 40 minutes, flow rate 1.2ml/minute, retention time 19.24 minutes, no detectable impurities.

__

2-Propylpentanoyl-(D)Lys-NMe(D)Phe-(D)Trp-piperazine-4-nitrophenyl

This title compound was prepared using a similar method to that of example 4. The protected peptide amide had a retention time of 22 minutes on RP-HPLC (column and conditions as for the protected peptide acid below). After deprotection with TFA and scavengers, preparative RP-HPLC was performed exactly as described for the proceeding example and fractions which contained product (eluting at 40 minutes) were combined and freeze dried. Yield 93mg.

10 RP-HPLC (column and conditions as for the previous example) retention time 17.92 minutes; mass spectroscopy, m/e (positive electrospray (ES*) 809.6 (MH*).

The starting material was prepared as follows:

2-Propylpentanoyl-(D)Lys(BOC)-NMe(D)Phe-DTrp-OH was prepared by the same method as described in example 4, but on a smaller scale (0.33mmol). Yield 248mg (82%).

15 RP-HPLC Vydac C18 column, 201HS54, 4.6x250mm, eluting with acetonitrile and water containing 0.1% TFA, using a 25-90% acetonitrile gradient over 40 minutes, flow rate 1.2ml/minute, retention time 18 minutes, no detectable impurities.

4,5-Dimethoxy-2-nitrobcnzoyl-NMeTrp-piperazine-4-nitrophenyl

A portion of 4,5-dimethoxy-2-nitrobenzoyl-NMcTrp-OH (43mg, 0.1mmol) was coupled to 4-(nitrophenyl)piperazine (21mg, 0.1 mmol) in DMF (4ml) using diisopropylethylamine (80 microlitres, 4 equivalents) and HATU (38mg, 1mmol). The reaction was complete after 1 hour, as judged by HPLC. The solution was diluted with water (2ml), filtered and put directly on a Dynamax C18 preparative column and eluted with a gradient of acetonitrile - water containing 0.1% TFA (20-70% acetonitrile) over 70 minutes at a flow rate of 12ml/minute. Fractions which contained product (eluting at 65 minutes) were combined and freeze dried. Yield 32mg.

RP-HPLC retention time 19.83 minutes (column and conditions as for previous example); mass spectroscopy, m/e (negative electrospray (ES')) 615.4 (MH').

The starting material was prepared as follows:

4,5-Dimethoxy-2-nitrobenzoyl-NMeTrp-OH was prepared from 2-chlorotritylchloride resin (Alexis, 380mg, 0.5mmol) by the automated procedure described in example 4. After coupling Fmoc-NMeTrp-OH to the resin and subsequent Fmoc-deprotection, 4,5-dimethoxy-2-nitrobenzoic acid was coupled to the resin-bound NMethyl-Trp by the HATU procedure. The completed resin was collected and washed with methanol and dried at 50°. Yield 487mg (gain 107mg).

The 4,5-dimethoxy-2-nitrobenzoyl-NMeTrp-OH was cleaved from the resin with dichloromethane, trifluoroethanol and acetic acid as described previously. It was freeze-dried from water and acctonitrile. Yield 173mg (yellow powder) (82%) RP-HPLC at 50°C, Vydac C18, 201HS54 column, 4.6x250mm, eluting with a gradient of 5-50% acetonitrile, 0.1% TFA

acetonitrile - water over 40 minutes, flow rate 1.3ml/minute, retention time 17.26 minutes, mass spectroscopy, m/e (negative electrospray (ES')) 425.6 (MH').

Example 9

2-Methyl-3-furoyl-Trp-piperazine-4-nitrophenyl

The amminolysis of 2-methyl-3-furoyl-Trp-O-Kaiser's oxime resin was carried out at 80°C in trichloroethane for 2 hours with 1 equivalent of 4-nitrophenylpiperazine and acetic acid (1-2 molar). The mixture was filtered and the resin was washed repeatedly with dichloromethane. The combined filtrate and washings were evaporated to dryness and the residue was dissolved in water (4ml) and acetonitrile (4ml) for HPLC and LC-MS, then freeze dried. Yield 29.8mg.

10 RP-HPLC column and elements as for previous examples, gradient 5-70%, 0.1% TFA acetonitrile -water over 40 minutes, flow 1.2ml/minute. Indicated that main peak (retention time 25.5 minutes) was expected product, (65.7% by peak integration at 230nm). LC MS MH+ for main peak 502.3 (cale 501.55 mw).

The starting material was prepared as follows:

BOC-Trp-OH (4.6g, 15 mmol) was dissolved in dichloromethane (30ml) containing DMF (3ml) and diisopropylcarbodiimide (0.95g, 7.5mmol) was added. After 20 minutes at ambient temperature, the solution of preformed symmetrical anhydride was added to a bond-elute tube (80ml) containing Kaiser's oxime resin (5g, 1.21 mmol/g, 6mmol), which was already swollen in dichloromethane. After manual mixing for 5 minutes, dimethylamino pyridine (92mg, 0.75 mmol) was added and mixing continued at intervals over 2 hours. The resin was filtered and washed repeatedly with dichloromethane. Unreacted sites on the resin were then "capped" with 2,6-dichlorobenzoylchloride (0.63g, 3mmol) in dichloromethane

(30ml). After 1 hour at ambient temperature, the resin was filtered and washed with dichloromethane.

Deprotection was performed with 25% TFA in dichloromethane containing triisopropylsilane (5%). Three separate treatments carried out for 10 minutes each to ensure complete removal of BOC group. After extensive washing with dichloromethane to ensure most of the surplus TFA had been removed, the resin was divided into roughly equal portions, into 50 bond elute tubes (3ml) to give 0.12 mmol of TFA salt of Trp-O-oxime resin per tube.

PCT/GB99/02957

To one of these portions of loaded resin, was added 2-methyl-3-furoic acid (64mg, 0.5mmol) dissolved in a solution of HBTU in DMF (0.33M, 1.5ml, 1 equivalent), followed after brief mixing, by isopropylethylamine (263 microlitre, 1.5mmol). After 5 hours at ambient temperature, the resin was filtered and washed with DMF to afford 2-methyl-3-furoyl-Trp-O-oxime resin.

BOC-(L)-Trp-oxime resin (100mg 110µmol) (prepared as in example 9) was placed in a reactor (8ml Bond-Elut). The instrument had been programmed to swell the resin by rinsing with dichloromethane. The resin was next treated 4 x 10 minutes with 25% TFA in dichloromethane which removes the BOC group. The resin was rinsed 6 times for 1 minute with dichloromethane, followed by 6 rinses for 1 minute with DMF. 2,4-Dimethylthiazole-5-carboxylic acid DIPEA (1000 µl of 0.5M) in NMP (1.0M) and HBTU in NMP (1100µl 0.45M) were added to the resin. The mixture was stirred briefly by hand then allowed to proceed for 1hour. The reaction mixture was drained and the resin rinsed 6 times with DMF and 3 times with dichloromethane and allowed to air dry to give 2,4-dimethylthiazole-5-carbonyl-(L)-Trp-oxime resin.

- 43 -

The resin was transferred to a sealed reaction vessel and suspended in TCE (2ml). The suspension was treated with 1ml of a solution containing N-(4-nitrophenyl)-piperazine (100 µmol) and glacial acetic acid (400 µmol). The reaction vessel was sealed then left overnight in an oven at 75-80°C. After the overnight reaction, the reaction mixture was filtered, the residual resin was rinsed 4 times with DMSO (0.5ml). The combined filtrates were evaporated to dryness on a centrifugal evaporator and the residue was re-dissolved in DMSO (5ml ca 20mM solution). The solution was stored frozen at -20°C.

A sample of the solution was diluted 50 times with water to provide a sample for LC-MS analysis:

L, is hydrogen or methyl;

R₁ and R₂ and R, are each independently hydrogen, halo, nitro, cyano, carbamoyl, N-(C, alkyl)carbamoyl, NN-(diC, alkyl)carbamoyl or C, alkoxycarbonyl;

R, is indole, N-(C_{1.4} alkyl) indole, C_{2.7} carbocyclic ring or aryl, any of which can be optionally substituted on ring carbon atoms with up to three substituents each independently selected from halo, C, alkyl, or C, alkoxy;

 R_s is hydrogen, $C_{1,s}$ alkyl, R_sCH_2 or $R_sC(O)$;

R₆ is aryl, heteroaryl, heterocyclyl, aminoC_{1.6}alkyl, N-(C_{1.4}alkyl)aminoC_{1.6}alkyl, NN-(diC1_alkyl)aminoC3_alkyl, or R7; wherein the aryl, heteroaryl or heterocyclyl rings may be optionally substituted with up to three substituents independently selected from nitro, C1, alkyl, C1, alkoxy, halo, (C1, alkyl) sulfanyl, C_{14} alkoxycarbonyl, \underline{N} - $(C_{14}$ alkyl)carbamoyl, \underline{NN} - $(diC_{14}$ alkyl)carbamoyl, N-(C14 alkyl)amino or NN-(diC14 alkyl)amino;

Formula (6)

5

wherein R, is either a group of formula (5) of formula (6):

10

20

30

35

40

45

5

10

wherein:

L2, L3 and L4 are each independently hydrogen or methyl; 25

R_s is amino, guanadino, imidazolo, any of which can be mono or di-N-substituted with C1.4alkyl;

A₁ is oxygen or a direct bond;

Formula (5)

R, is a Cs. membered mono-carbocyclic ring, a Cs. membered bi-carbocyclic ring, C_{s.12} membered tri-carbocyclic ring, C_{s.7}alkyl or aryl, any of which can be optionally mono, bi or tri substituted by C_{1.4} alkyl;

R₁₀ is C_{1.6}alkyl or a C_{1.8}mono-carbocyclic ring; 15

R₁₁ is hydrogen, halo, C₁₋₄alkyl, or C₁₋₄alkoxy;

R₁₂ is hydrogen or methyl or ethyl or R₁₂ together with L₂ forms a C_{5.7} nitrogencontaining heterocyclic ring;

 R_{13} is hydrogen or methyl ethyl or R_{13} together with L_4 forms a $C_{5.7}$ nitrogen-20 containing heterocyclic ring;

n is 0, 1 or 2;

p is 0, 1 or 2;

q is an integer from 1 to 6

r is 0, 1 or 2;

25 s is 0, 1 or 2;

provided that when R₆ is aryl, heteroaryl, heterocyclyl, aminoC_{1.6}alkyl, N-(C14alkyl)aminoC16alkyl or NN-(diC14alkyl)aminoC16alkyl then R, is other than R₆CH₂-; or a pharmaceutically acceptable salt, prodrug or solvate thereof. 10

10

15

20

5 15. A method of treating cancers which comprises administering to a warm-blooded animal an effective amount of a compound of formula (4).

15

A pharmaceutical composition comprising a compound of formula (4), or a 16. pharmaceutically acceptable salt, prodrug or solvate thereof, in admixture with a pharmaceutically-acceptable diluent or carrier for the treatment of cancer in a warmblooded animal.

20

A process for preparing a compound of the formula (1) or a pharmaceutically 17. acceptable salt, prodrug or solvate thereof which process comprises:

25

a) reacting a carboxylic acid of Formula (8) or a reactive derivative thereof with a piperazine of formula (9)

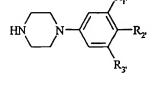

30

35

40

$$\begin{array}{c|c} R_{s} & \bigcap_{N \to \infty} C_{N} \\ & (CH_{2})_{n} \\ & \vdots \\ & R_{4} \end{array}$$

Formula (8)

Formula (9)

wherein L₁, n, R₄, R₁-R₃ and R₅ are as herein above defined. To form a compound of Formula (7)

50

45

- 51 -

 $R_{s} \xrightarrow{I_{1}} O N \longrightarrow R$ $(CH_{2})_{n} \qquad R$

Formula (7)

b) removing any protecting groups,

c) optionally forming a pharmaceutically acceptable salt, prodrug or solvate.

mational application No. PCT/GB 99/02957

		FC17 8B 997 02937
Box I	Observations where certain claims were found unsearchable (Continu	ation of item 1 of first sheet)
This inte	emational Search Report has not been established in respect of certain claims under A	Article 17(2)(a) for the following reasons:
1. X	Ctaims Nos.: 13.15 because they relate to subject matter not required to be searched by this Authority. In Remark: Although claims 13 and 15 are directed to a method of treatment of body, the search has been carried out and effects of the compounds.	the human/animal
2.	Claims Nos.: because they relate to parts of the International Application that do not comply with the an extent that no meaningful International Search can be carried out, specifically:	ne crescribed requirements to such
3.	Claims Nos.: because they are dependent claims and are not drafted in accordance with the second	nd and third sentences of Rule 6.4(a).
Box II	Observations where unity of invention is lacking (Continuation of item	2 of first sheet)
		Court Pourt and an
'· 📋	As all required additional search fees were timely paid by the applicant, this International searchable claims. As all searchable claims could be searched without effort justifying an additional fee.
